Shortcomings

Module Summary

- Leveraging an innovative solution to the Salary Processing Application in C using function pointers, we compare C and C++ solutions to the problem
- The new C solution with function pointers is used to explain the mechanism for dynamic binding (polymorphic dispatch) based on `virtual` function tables
- Understood casting in C and C++
- Explained cast operators in C++ and discussed the evils of C-style casting
- Studied `const_cast`, `static_cast`, `reinterpret_cast`, and `dynamic_cast` with examples
- Understood casting at run-time with RTTI and `typeid` operator
- Introduced the Semantics of Multiple Inheritance in C++
- Discussed the Diamond Problem and solution approaches
- Illustrated the design choice between inheritance and composition

C Language Features

RV & Params

Local goto

C Standard Library Support

Global Variables

Abnormal Termination

Conditional Termination

Non-Local goto

Signals

Shortcomings

Module Summary

- Conditions that arise
 - Infrequently and Unexpectedly
 - Generally betray a Program Error
 - Require a considered Programmatic Response
 - Run-time Anomalies – yes, but not necessarily
- Leading to
 - Crippling the Program
 - May pull the entire System down
 - Defensive Technique
 - ▷ Crashing Exceptions verses Tangled Design and Code

Exception Causes

Global Variables

Abnormal Termination

Conditional Termination

Non-Local goto

Signals

Shortcomings

Module Summary

- Unexpected Systems State
 - Exhaustion of Resources
 - ▷ Low Free Store Memory
 - ▷ Low Disk Space
 - Pushing to a Full Stack
- External Events
 - \hat{C}
 - Socket Event
- Logical Errors
 - Pop from an Empty Stack
 - Resource Errors – like Memory Read/Write
- Run time Errors
 - Arithmetic Overflow / Underflow
 - Out of Range
- Undefined Operation
 - Division by Zero

Exception Handling?

Module M36

Partha Pratim Das

Weekly Recap

Objective & Outline

Exception Fundamentals

Types of Exceptions

Exception Stages

Error Handling in C

C Language Features

RV & Params

Local goto

C Standard Library Support

Global Variables

Abnormal Termination

Conditional Termination

Non-Local goto

Signals

Shortcomings

Module Summary

- Exception Handling is a mechanism that separates the detection and handling of circumstantial **Exceptional Flow** from **Normal Flow**
- Current state saved in a pre-defined location
- Execution switched to a pre-defined handler

Exceptions are C++'s means of separating error reporting from error handling

– Bjarne Stroustrup

Types of Exceptions

Module M36

Partha Pratim Das

Weekly Recap

Objective & Outline

Exception Fundamentals

Types of Exceptions

Exception Stages

Error Handling in C

C Language Features

RV & Params

Local goto

C Standard Library Support

Global Variables

Abnormal Termination

Conditional Termination

Non-Local goto

Signals

Shortcomings

Module Summary

- **Asynchronous Exceptions:**

- Exceptions that come Unexpectedly
- Example – an Interrupt in a Program
- Takes control away from the Executing Thread context to a context that is different from that which caused the exception

- **Synchronous Exceptions:**

- Planned Exceptions
- Handled in an organized manner
- The most common type of Synchronous Exception is implemented as a **throw**

Exception Stages

Module M36

Partha Pratim Das

Weekly Recap

Objective & Outline

Exception Fundamentals

Types of Exceptions

Exception Stages

Error Handling in C

C Language Features

RV & Params

Local goto

C Standard Library Support

Global Variables

Abnormal Termination

Conditional Termination

Non-Local goto

Signals

Shortcomings

Module Summary

[1] Error Incidence

- **Synchronous** (S/W) Logical Error
- **Asynchronous** (H/W) Interrupt (S/W Interrupt)

[2] Create Object & Raise Exception

- An Exception Object can be of any Complete Type - an **int** to a full blown **C++ class object**

[3] Detect Exception

- **Polling** – Software Tests
- **Notification** – Control (Stack) Adjustments

[4] Handle Exception

- **Ignore**: hope someone else handles it, that is, Do Not Catch
- **Act**: but allow others to handle it afterwards, that is, Catch, Handle and Re-Throw
- **Own**: take complete ownership, that is, Catch and Handle

[5] Recover from Exception

- **Continue Execution**: If handled inside the program
- **Abort Execution**: If handled outside the program

Exception Stages

C Language Features

RV & Params

Local goto

C Standard Library Support

Global Variables

Abnormal Termination

Conditional Termination

Non-Local goto

Signals

Shortcomings

Module Summary

- Support for Error Handling in C

- C language does not provide any specific feature for error handling. Consequently, developers are forced to use normal programming features in a disciplined way to handle errors. This has led to industry practices that the developers should abide by
- C Standard Library provides a collection of headers that can be used for handling errors in different contexts. None of them is complete in itself, but together they kind of cover most situations. This again has led to industry practices that the developers should follow

- Language Features

- Return Value & Parameters
- Local **goto**

- Standard Library Support

- Global Variables (**<errno.h>**)
- Abnormal Termination (**<stdlib.h>**)
- Conditional Termination (**<assert.h>**)
- Non-Local **goto** (**<setjmp.h>**)
- Signals (**<signal.h>**)

Return Value & Parameters

Types of Exceptions

Exception Stages

Error Handling in C

C Language Features

RV & Params

Local goto

C Standard Library Support

Global Variables

Abnormal Termination

Conditional Termination

Non-Local goto

Signals

Shortcomings

Module Summary

- Function Return Value Mechanism
 - Created by the Callee as Temporary Objects
 - Passed onto the Caller
 - Caller checks for Error Conditions
 - Return Values can be ignored and lost
 - Return Values are temporary
- Function (output) Parameter Mechanism
 - Outbound Parameters
 - Bound to arguments
 - Offer multiple logical Return Values

Example: Return Value & Parameters

Module Summary

- `setjmp()` and `longjmp()` functions provided in `<setjmp.h>` Header along with collateral type `jmp_buf`
- `setjmp(jmp_buf)`
 - Sets the Jump point filling up the `jmp_buf` object with the current program context
- `longjmp(jmp_buf, int)`
 - Effects a Jump to the context of the `jmp_buf` object
 - Control return to `setjmp` call last called on `jmp_buf`

Termination

Conditional
Termination

Non-Local goto

Signals

Shortcomings

Module Summary

- Header `<signal.h>`
- `raise()`
 - Sends a signal to the executing program
- `signal()`
 - Registers interrupt signal handler
 - Returns the previous handler associated with the given signal
- Converts h/w interrupts to s/w interrupts

Example: Signals

Module M36

Exception Stages

Error Handling in C

C Language Features

RV & Params

Local goto

C Standard Library Support

Global Variables

Abnormal Termination

Conditional Termination

Non-Local goto

Signals

Shortcomings

Module Summary

```
// Use signal to attach a signal
// handler to the abort routine
#include <stdio.h>
#include <stdlib.h>
#include <signal.h>

void SignalHandler(int signal) {
    printf("Application aborting...\n");
}

int main() {
    typedef void (*SignalHandlerPointer)(int);

    SignalHandlerPointer previousHandler;

    previousHandler = signal(SIGABRT, SignalHandler);

    abort();

    return 0;
}
```

Application aborting...

Conditional Termination

Non-Local goto

Signals

Shortcomings

Module Summary

- **Destructor-ignorant:**
 - Cannot release Local Objects i.e. Resources Leak
- **Obtrusive:**
 - Interrogating RV or GV results in Code Clutter
- **Inflexible:**
 - Spoils Normal Function Semantics
- **Non-native:**
 - Require Library Support outside Core Language

Module Summary

- Introduced the concept of exceptions
- Discussed error handling in C
- Illustrated various language features and library support in C for handling errors
- Demonstrated with examples
