

# Propositional Logic

# Propositional logic

- **Logical constants:** true, false
- **Propositional symbols:** P, Q, S, ... (atomic sentences)
- Wrapping **parentheses:** ( ... )
- Sentences are combined by **connectives**:
  - $\wedge$  ...and [conjunction]
  - $\vee$  ...or [disjunction]
  - $\Rightarrow$ ...implies [implication / conditional]
  - $\Leftrightarrow$ ..is equivalent [biconditional]
  - $\neg$  ...not [negation]
- **Literal:** atomic sentence or negated atomic sentence

# Examples of PL sentences

- P means “It is hot.”
- Q means “It is humid.”
- R means “It is raining.”
- $(P \wedge Q) \rightarrow R$   
“If it is hot and humid, then it is raining”
- $Q \rightarrow P$   
“If it is humid, then it is hot”
- A better way:  
Hot = “It is hot”  
Humid = “It is humid”  
Raining = “It is raining”

# Propositional logic (PL)

- A simple language useful for showing key ideas and definitions
- User defines a set of propositional symbols, like P and Q.
- User defines the **semantics** of each propositional symbol:
  - P means “It is hot”
  - Q means “It is humid”
  - R means “It is raining”
- A sentence (well formed formula) is defined as follows:
  - A symbol is a sentence
  - If S is a sentence, then  $\neg S$  is a sentence
  - If S is a sentence, then (S) is a sentence
  - If S and T are sentences, then  $(S \vee T)$ ,  $(S \wedge T)$ ,  $(S \rightarrow T)$ , and  $(S \leftrightarrow T)$  are sentences
  - A sentence results from a finite number of applications of the above rules

# A BNF grammar of sentences in propositional logic

```
S := <Sentence> ;  
<Sentence> := <AtomicSentence> | <ComplexSentence> ;  
<AtomicSentence> := "TRUE" | "FALSE" |  
                    "P" | "Q" | "S" ;  
<ComplexSentence> := "(" <Sentence> ")" |  
                    <Sentence> <Connective> <Sentence> |  
                    "NOT" <Sentence> ;  
<Connective> := "NOT" | "AND" | "OR" | "IMPLIES" |  
                "EQUIVALENT" ;
```

# Some terms

- The meaning or **semantics** of a sentence determines its **interpretation**.
- Given the truth values of all symbols in a sentence, it can be “evaluated” to determine its **truth value** (True or False).
- A **model** for a KB is a “possible world” (assignment of truth values to propositional symbols) in which each sentence in the KB is True.

# More terms

- A **valid sentence** or **tautology** is a sentence that is True under all interpretations, no matter what the world is actually like or how the semantics are defined. Example: “It’s raining or it’s not raining.”
- An **inconsistent sentence** or **contradiction** is a sentence that is False under all interpretations. The world is never like what it describes, as in “It’s raining and it’s not raining.”
- **P entails Q**, written  $P \models Q$ , means that whenever P is True, so is Q. In other words, all models of P are also models of Q.

# Truth tables

*And*

| $p$ | $q$ | $p \cdot q$ |
|-----|-----|-------------|
| $T$ | $T$ | $T$         |
| $T$ | $F$ | $F$         |
| $F$ | $T$ | $F$         |
| $F$ | $F$ | $F$         |

*Or*

| $p$ | $q$ | $p \vee q$ |
|-----|-----|------------|
| $T$ | $T$ | $T$        |
| $T$ | $F$ | $T$        |
| $F$ | $T$ | $T$        |
| $F$ | $F$ | $F$        |

*If ... then*

| $p$ | $q$ | $p \rightarrow q$ |
|-----|-----|-------------------|
| $T$ | $T$ | $T$               |
| $T$ | $F$ | $F$               |
| $F$ | $T$ | $T$               |
| $F$ | $F$ | $T$               |

*Not*

| $p$ | $\sim p$ |
|-----|----------|
| $T$ | $F$      |
| $F$ | $T$      |

# Truth tables II

The five logical connectives:

| $P$          | $Q$          | $\neg P$     | $P \wedge Q$ | $P \vee Q$   | $P \Rightarrow Q$ | $P \Leftrightarrow Q$ |
|--------------|--------------|--------------|--------------|--------------|-------------------|-----------------------|
| <i>False</i> | <i>False</i> | <i>True</i>  | <i>False</i> | <i>False</i> | <i>True</i>       | <i>True</i>           |
| <i>False</i> | <i>True</i>  | <i>True</i>  | <i>False</i> | <i>True</i>  | <i>True</i>       | <i>False</i>          |
| <i>True</i>  | <i>False</i> | <i>False</i> | <i>False</i> | <i>True</i>  | <i>False</i>      | <i>False</i>          |
| <i>True</i>  | <i>True</i>  | <i>False</i> | <i>True</i>  | <i>True</i>  | <i>True</i>       | <i>True</i>           |

A complex sentence:

| $P$          | $H$          | $P \vee H$   | $(P \vee H) \wedge \neg H$ | $((P \vee H) \wedge \neg H) \Rightarrow P$ |
|--------------|--------------|--------------|----------------------------|--|
| <i>False</i> | <i>False</i> | <i>False</i> | <i>False</i>               | <i>True</i>                                |
| <i>False</i> | <i>True</i>  | <i>True</i>  | <i>False</i>               | <i>True</i>                                |
| <i>True</i>  | <i>False</i> | <i>True</i>  | <i>True</i>                | <i>True</i>                                |
| <i>True</i>  | <i>True</i>  | <i>True</i>  | <i>False</i>               | <i>True</i>                                |

# Models of complex sentences

$P \vee Q$

$P \wedge Q$

$P \Rightarrow Q$

$P \Leftrightarrow Q$

# Inference rules

- **Logical inference** is used to create new sentences that logically follow from a given set of predicate calculus sentences (KB).
- An inference rule is **sound** if every sentence X produced by an inference rule operating on a KB logically follows from the KB. (That is, the inference rule does not create any contradictions)
- An inference rule is **complete** if it is able to produce every expression that logically follows from (is entailed by) the KB. (Note the analogy to complete search algorithms.)

# Sound rules of inference

- Here are some examples of sound rules of inference
  - *A rule is sound if its conclusion is true whenever the premise is true*
- Each can be shown to be sound using a truth table

| <u>RULE</u>      | <u>PREMISE</u>            | <u>CONCLUSION</u> |
|------------------|---------------------------|-------------------|
| Modus Ponens     | $A, A \rightarrow B$      | $B$               |
| And Introduction | $A, B$                    | $A \wedge B$      |
| And Elimination  | $A \wedge B$              | $A$               |
| Double Negation  | $\neg\neg A$              | $A$               |
| Unit Resolution  | $A \vee B, \neg B$        | $A$               |
| Resolution       | $A \vee B, \neg B \vee C$ | $A \vee C$        |

# Soundness of modus ponens

| <b>A</b> | <b>B</b> | <b><math>A \rightarrow B</math></b> | <b>OK?</b> |
|----------|----------|-------------------------------------|------------|
| True     | True     | True                                | ✓          |
| True     | False    | False                               | ✓          |
| False    | True     | True                                | ✓          |
| False    | False    | True                                | ✓          |

# Soundness of the resolution inference rule

| $\alpha$            | $\beta$             | $\gamma$            | $\alpha \vee \beta$ | $\neg\beta \vee \gamma$ | $\alpha \vee \gamma$ |
|---------------------|---------------------|---------------------|---------------------|-------------------------|----------------------|
| <i>False</i>        | <i>False</i>        | <i>False</i>        | <i>False</i>        | <i>True</i>             | <i>False</i>         |
| <i>False</i>        | <i>False</i>        | <i>True</i>         | <i>False</i>        | <i>True</i>             | <i>True</i>          |
| <i>False</i>        | <i>True</i>         | <i>False</i>        | <i>True</i>         | <i>False</i>            | <i>False</i>         |
| <u><i>False</i></u> | <u><i>True</i></u>  | <u><i>True</i></u>  | <u><i>True</i></u>  | <u><i>True</i></u>      | <u><i>True</i></u>   |
| <u><i>True</i></u>  | <u><i>False</i></u> | <u><i>False</i></u> | <u><i>True</i></u>  | <u><i>True</i></u>      | <u><i>True</i></u>   |
| <u><i>True</i></u>  | <u><i>False</i></u> | <u><i>True</i></u>  | <u><i>True</i></u>  | <u><i>True</i></u>      | <u><i>True</i></u>   |
| <i>True</i>         | <i>True</i>         | <i>False</i>        | <i>True</i>         | <i>False</i>            | <i>True</i>          |
| <u><i>True</i></u>  | <u><i>True</i></u>  | <u><i>True</i></u>  | <u><i>True</i></u>  | <u><i>True</i></u>      | <u><i>True</i></u>   |

# Proving things

- A **proof** is a sequence of sentences, where each sentence is either a premise or a sentence derived from earlier sentences in the proof by one of the rules of inference.
- The last sentence is the **theorem** (also called goal or query) that we want to prove.
- Example for the “weather problem” given above.

|                    |                       |                                     |
|--------------------|-----------------------|-------------------------------------|
| 1 Humid            | Premise               | “It is humid”                       |
| 2 Humid→Hot        | Premise               | “If it is humid, it is hot”         |
| 3 Hot              | Modus Ponens(1,2)     | “It is hot”                         |
| 4 (Hot∧Humid)→Rain | Premise               | “If it’s hot & humid, it’s raining” |
| 5 Hot∧Humid        | And Introduction(1,2) | “It is hot and humid”               |
| 6 Rain             | Modus Ponens(4,5)     | “It is raining”                     |

# Horn sentences

- A **Horn sentence** or **Horn clause** has the form:

$$P_1 \wedge P_2 \wedge P_3 \dots \wedge P_n \rightarrow Q$$

or alternatively

$$\neg P_1 \vee \neg P_2 \vee \neg P_3 \dots \vee \neg P_n \vee Q$$

$$(P \rightarrow Q) = (\neg P \vee Q)$$

where  $P$ s and  $Q$  are non-negated atoms

- To get a proof for Horn sentences, apply Modus Ponens repeatedly until nothing can be done
- We will use the Horn clause form later

# Entailment and derivation

- **Entailment:  $KB \models Q$**

- Q is entailed by KB (a set of premises or assumptions) if and only if there is no logically possible world in which Q is false while all the premises in KB are true.
- Or, stated positively, Q is entailed by KB if and only if the conclusion is true in every logically possible world in which all the premises in KB are true.

- **Derivation:  $KB \vdash Q$**

- We can derive Q from KB if there is a proof consisting of a sequence of valid inference steps starting from the premises in KB and resulting in Q

# Two important properties for inference

## **Soundness: If $KB \vdash Q$ then $KB \models Q$**

- If  $Q$  is derived from a set of sentences  $KB$  using a given set of rules of inference, then  $Q$  is entailed by  $KB$ .
- Hence, inference produces only real entailments, or any sentence that follows deductively from the premises is valid.

## **Completeness: If $KB \models Q$ then $KB \vdash Q$**

- If  $Q$  is entailed by a set of sentences  $KB$ , then  $Q$  can be derived from  $KB$  using the rules of inference.
- Hence, inference produces all entailments, or all valid sentences can be proved from the premises.

# Propositional logic is a weak language

- Hard to identify “individuals” (e.g., Mary, 3)
- Can’t directly talk about properties of individuals or relations between individuals (e.g., “Bill is tall”)
- Generalizations, patterns, regularities can’t easily be represented (e.g., “all triangles have 3 sides”)
- First-Order Logic (abbreviated FOL or FOPC) is expressive enough to concisely represent this kind of information

FOL adds relations, variables, and quantifiers, e.g.,

- “*Every elephant is gray*”:  $\forall x (\text{elephant}(x) \rightarrow \text{gray}(x))$
- “*There is a white alligator*”:  $\exists x (\text{alligator}(X) \wedge \text{white}(X))$

# Example

- Consider the problem of representing the following information:
  - Every person is mortal.
  - Confucius is a person.
  - Confucius is mortal.
- How can these sentences be represented so that we can infer the third sentence from the first two?

## Example II

- In PL we have to create propositional symbols to stand for all or part of each sentence. For example, we might have:  
P = “person”; Q = “mortal”; R = “Confucius”
- so the above 3 sentences are represented as:  
 $P \rightarrow Q; R \rightarrow P; R \rightarrow Q$
- Although the third sentence is entailed by the first two, we needed an explicit symbol, R, to represent an individual, Confucius, who is a member of the classes “person” and “mortal”
- To represent other individuals we must introduce separate symbols for each one, with some way to represent the fact that all individuals who are “people” are also “mortal”

# Summary

- The process of deriving new sentences from old one is called **inference**.
  - **Sound** inference processes derives true conclusions given true premises
  - **Complete** inference processes derive all true conclusions from a set of premises
- A **valid sentence** is true in all worlds under all interpretations
- If an implication sentence can be shown to be valid, then—given its premise—its consequent can be derived
- Different logics make different **commitments** about what the world is made of and what kind of beliefs we can have regarding the facts
  - Logics are useful for the commitments they do not make because lack of commitment gives the knowledge base engineer more freedom
- **Propositional logic** commits only to the existence of facts that may or may not be the case in the world being represented
  - It has a simple syntax and simple semantics. It suffices to illustrate the process of inference
  - Propositional logic quickly becomes impractical, even for very small worlds
